

C8000V IPsec Testbed

Test evidence — every command run on every device

Run started	08 September 2026, 11:27 UTC
Duration	25.5 minutes
Result	224 of 224 tests passed
Suites	24
Device commands recorded	1610
Topology	hub-and-spoke: R1 hub, R2 and R3 spokes, one Linux host per router
Encryption	IKEv2 + static VTI, ESP-AES-256 / SHA256, one tunnel per spoke
Routing	eBGP inside the tunnels; AS 65001 hub, AS 65002 / 65003 spokes

Suite results

Suite	Tests	Passed	Failed	Commands	Time
01 Platform	5	5	0	10	1s
02 Configuration	5	5	0	14	2s
03 Wan	6	6	0	19	1s
04 Dmvpn	13	13	0	37	25s
05 Capture State	12	12	0	79	16s
06 Wire Encryption	3	3	0	27	34s
07 Ipsec Negative	3	3	0	63	126s
08 Management Api	6	6	0	7	3s

20 Tacacs	12	12	0	35	25s
21 Vty Acl	9	9	0	22	1s
22 Banner	6	6	0	6	21s
23 Destructive	7	7	0	180	291s
24 Terraform	9	9	0	20	10s

Each test below lists the commands it issued, in order, with the device that ran them and the output it returned. Router commands are marked in teal, Linux host commands in amber. Long output is trimmed to the first 14 lines; complete captures are in results/.

01 Platform

1.01 PASS Both Routers Report Catalyst 8000V Software (0.2s, 2 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output matches **Cisco IOS[-]XE Software, Version ld+l.ld+** (checked 2×)
- output contains **C8000V** (checked 2×)

How it was checked

R1 show version

```
Cisco IOS XE Software, Version 17.15.06

Teardown (suite) Close All Routers

1.02 PASS Hostnames Match The Day0 Bootstrap Configs (0.2s, 2 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **\${expected}** (checked 2×)

How it was checked

R1 show running-config | include ^hostname

```
hostname c8000v-r1
```

R2 show running-config | include ^hostname

```
hostname c8000v-r2
```

Teardown (suite) Close All Routers

1.03 PASS Management Interfaces Are Up With DHCP Addresses (0.1s, 2 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output matches **GigabitEthernet1s+10\0.0\2\ld+ls+YES\DHCP\up\up** (checked 2×)

How it was checked

R1 `show ip interface brief GigabitEthernet1`

Interface	IP-Address	OK?	Method	Status	Protocol
GigabitEthernet1	10.0.2.15	YES	DHCP	up	up

R2 `show ip interface brief GigabitEthernet1`

Interface	IP-Address	OK?	Method	Status	Protocol
GigabitEthernet1	10.0.2.15	YES	DHCP	up	up

Teardown (suite) Close All Routers

1.04 **PASS** Crypto Feature License Is Active (0.1s, 2 commands)

Without a feature license the crypto CLI does not exist at all, so every IPsec test downstream depends on this.

Setup (suite) Open All Routers

Acceptance criteria

- output matches **License Level:ls*S+** (checked 2×)

How it was checked

R1 `show version | include License Level`

```
License Level: network-premier
Addon License Level: dna-premier
```

R2 `show version | include License Level`

```
License Level: network-premier
Addon License Level: dna-premier
```

Teardown (suite) Close All Routers

1.05 **PASS** Management Plane Services Are Enabled (0.2s, 2 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **netconf-yang** (checked 2×)
- output contains **restconf** (checked 2×)

How it was checked

R1 `show running-config | include ^netconf-yang|^restconf`

```
netconf-yang
restconf
```

R2 `show running-config | include ^netconf-yang|^restconf`

```
netconf-yang
restconf
```

Teardown (suite) Close All Routers

02 Configuration

2.01 PASS Create A Loopback Interface (0.1s, 6 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain % **Invalid input**
- output does not contain % **Incomplete command**
- output does not contain % **Ambiguous command**

How it was checked

R1 configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

R1 interface Loopback100

#{output} =

R1 description ROBOT-MANAGED

#{output} =

R1 ip address 192.0.2.1 255.255.255.0

#{output} =

R1 no shutdown

#{output} =

R1 end

#{output} =

Teardown (this test) Run Keyword If Test Failed (Log, #{TEST_NAME} failed -- see the console on port 5001)

2.02 PASS Loopback Appears In The Interface Table (0.0s, 1 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output matches **#{LOOPBACK}#{s}#{LOOPBACK_IP}#{s}+YES#{s}+manual#{s}+up#{s}+up**

How it was checked

R1 show ip interface brief Loopback100

Interface	IP-Address	OK?	Method	Status	Protocol
Loopback100	192.0.2.1	YES	manual	up	up

Teardown (this test) Run Keyword If Test Failed (Log, #{TEST_NAME} failed -- see the console on port 5001)

2.03 PASS Loopback Is Reachable From The Device Itself (2.0s, 2 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **Success rate is 100 percent**

How it was checked

R1 ping 192.0.2.1 repeat 2

Type escape sequence to abort.

Sending 2, 100-byte ICMP Echos to 192.0.2.1, timeout is 2 seconds:

..!

Success rate is 50 percent (1/2), round-trip min/avg/max = 1/1/1 ms

R1 ping 192.0.2.1 repeat 5

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 192.0.2.1, timeout is 2 seconds:

!!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms

Teardown (this test) Run Keyword If Test Failed (Log, #{TEST_NAME} failed -- see the console on port 5001)

2.04 PASS Loopback Is Present In The Running Config (0.1s, 1 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **description** ROBOT-MANAGED
- output contains **ip address** \${LOOPBACK_IP} \${LOOPBACK_MASK}

How it was checked

R1 show running-config interface Loopback100

Building configuration...

```
Current configuration : 92 bytes
!
interface Loopback100
  description ROBOT-MANAGED
  ip address 192.0.2.1 255.255.255.0
end
```

Teardown (this test) Run Keyword If Test Failed (Log, \${TEST_NAME} failed -- see the console on port 5001)

2.05 **PASS** Removing The Loopback Cleans It Up (0.1s, 4 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain \${LOOPBACK_IP}

How it was checked

R1 configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

R1 no interface Loopback100

\${output} =

R1 end

\${output} =

R1 show ip interface brief Loopback100

^

% Invalid input detected at '^' marker.

Teardown (this test) Run Keyword If Test Failed (Log, \${TEST_NAME} failed -- see the console on port 5001)

03 Wan

3.01 PASS Every Router Is On The Shared WAN Segment (0.1s, 3 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output matches **GigabitEthernet2** is **\${WAN_IP}** is **YES** is **IS** is **up** is **up** (checked 3×)

How it was checked

```
R1 show ip interface brief | include GigabitEthernet2
GigabitEthernet2    100.64.0.1      YES NVRAM  up          up
R2 show ip interface brief | include GigabitEthernet2
GigabitEthernet2    100.64.0.2      YES NVRAM  up          up
R3 show ip interface brief | include GigabitEthernet2
GigabitEthernet2    100.64.0.3      YES NVRAM  up          up
```

Teardown (suite) Close All Connections

3.02 PASS Every Router Can Reach Every Other Router On It (0.2s, 6 commands)

Including spoke to spoke, which is the precondition for a direct tunnel and the property the VTI lab deliberately did not have. Tested at the underlay, before any tunnel exists.

Setup (suite) Open All Routers

Acceptance criteria

- output contains **Success rate is 100 percent** (checked 6×)

How it was checked

```
R2 ping 100.64.0.2 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.2, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
R3 ping 100.64.0.3 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.3, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
R1 ping 100.64.0.1 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.1, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
R3 ping 100.64.0.3 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.3, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
R1 ping 100.64.0.1 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.1, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
R2 ping 100.64.0.2 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 100.64.0.2, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

Teardown (suite) Close All Connections

3.03 PASS The Spokes Reach Each Other Directly, Not Through The Hub (0.0s, 1 commands)

One hop at the underlay. If this became two the spokes would still have connectivity, and DMVPN would still form tunnels -- but every "direct" spoke-to-spoke path would quietly be transiting the hub anyway.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${R3_WAN_IP}`
- output does not contain `${R1_WAN_IP}`
the spokes reach each other via the hub at the underlay:\n\${trace}

How it was checked

R2 `traceroute 100.64.0.3 probe 1 timeout 1 numeric`

```
Type escape sequence to abort.
Tracing the route to 100.64.0.3
VRF info: (vrf in name/id, vrf out name/id)
 1 100.64.0.3 3 msec
```

Teardown (suite) Close All Connections

3.04 **PASS** Each Router Learns The Others On The Segment (0.1s, 3 commands)

A shared segment, so every router should have resolved every other -- unlike a point-to-point link with exactly one neighbour.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${WAN_IP}${peer}}` (checked 9×)

How it was checked

R1 `show ip arp GigabitEthernet2`

Protocol	Address	Age (min)	Hardware Addr	Type	Interface
Internet	100.64.0.1	-	5254.00c8.0102	ARPA	GigabitEthernet2
Internet	100.64.0.2	76	5254.00c8.0202	ARPA	GigabitEthernet2
Internet	100.64.0.3	78	5254.00c8.0302	ARPA	GigabitEthernet2

R2 `show ip arp GigabitEthernet2`

Protocol	Address	Age (min)	Hardware Addr	Type	Interface
Internet	100.64.0.2	-	5254.00c8.0202	ARPA	GigabitEthernet2
Internet	100.64.0.1	76	5254.00c8.0102	ARPA	GigabitEthernet2
Internet	100.64.0.3	50	5254.00c8.0302	ARPA	GigabitEthernet2

R3 `show ip arp GigabitEthernet2`

Protocol	Address	Age (min)	Hardware Addr	Type	Interface
Internet	100.64.0.3	-	5254.00c8.0302	ARPA	GigabitEthernet2
Internet	100.64.0.1	78	5254.00c8.0102	ARPA	GigabitEthernet2
Internet	100.64.0.2	50	5254.00c8.0202	ARPA	GigabitEthernet2

Teardown (suite) Close All Connections

3.05 **PASS** The Underlay Carries No Site Prefixes (0.1s, 3 commands)

The WAN is a transport, not a routing domain. A site prefix appearing here would mean traffic could reach a LAN without ever entering the tunnel -- unencrypted, and invisible to every test that watches the overlay.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain `${LAN_NET}${peer}}` (checked 9×)
would put site traffic on the underlay instead of the tunnel
- output contains `${WAN_NET}` (checked 3×)

How it was checked

R1 `show ip route | include GigabitEthernet2`

```
C    100.64.0.0/24 is directly connected, GigabitEthernet2
L    100.64.0.1/32 is directly connected, GigabitEthernet2
```

R2 `show ip route | include GigabitEthernet2`

```
C    100.64.0.0/24 is directly connected, GigabitEthernet2
L    100.64.0.2/32 is directly connected, GigabitEthernet2
```

R3 `show ip route | include GigabitEthernet2`

```
C    100.64.0.0/24 is directly connected, GigabitEthernet2
L    100.64.0.3/32 is directly connected, GigabitEthernet2
```

Teardown (suite) Close All Connections

3.06 PASS No Routing Protocol Runs On The WAN Segment (0.1s, 3 commands)

BGP peers over the tunnel, so the underlay should carry no adjacency at all. One here would be a second, unprotected path for the control plane.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain `${WAN_NET.rsplitt(' ', 2)[0]}`. (checked 3×)

How it was checked

R1 `show bgp ipv4 unicast summary | begin Neighbor`

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.2	4	65002	3364	3370	34	0	0	08:53:09	3
172.20.0.3	4	65003	3353	3358	34	0	0	08:51:52	3

R2 `show bgp ipv4 unicast summary | begin Neighbor`

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.1	4	65001	3370	3364	40	0	0	08:53:09	6

R3 `show bgp ipv4 unicast summary | begin Neighbor`

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.1	4	65001	3358	3353	386	0	0	08:51:52	6

Teardown (suite) Close All Connections

04 Dmvpn

4.01 PASS Every Router Runs One Multipoint Tunnel With No Destination (0.2s, 4 commands)

The structural difference from a static VTI. A configured destination would make this point-to-point again and there would be nothing for NHRP to resolve.

Setup (suite) Open All Routers

Acceptance criteria

- output contains **tunnel mode gre multipoint** (checked 3×)
- output does not contain **tunnel destination** (checked 3×)
- output contains **tunnel source GigabitEthernet2** (checked 3×)
- output contains **ip address \${DMVPN_IP}\${r}** (checked 3×)
- output contains **Number of lines which match regexp = 1**
the hub has more than one tunnel interface, which is the VTI shape

How it was checked

R1 show running-config interface Tunnel0

Building configuration...

```
Current configuration : 399 bytes
!
interface Tunnel0
  description DMVPN hub
  ip address 172.20.0.1 255.255.255.0

```

Teardown (suite) Restore Nhrp, Close All Connections

4.04 PASS The Hub Is The Next Hop Server And The Spokes Point At It (0.1s, 4 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **ip nhrp nhs** `${R1_DMVPN_IP}` **nbma** `${R1_WAN_IP}` (checked 2×)
- output does not contain **ip nhrp nhs**
the hub points at a next hop server, so it is behaving as a spoke
- output matches `${WAN_IP}[${r}]\s+${DMVPN_IP}[${r}]\s+UP` (checked 2×)
- **\${dynamic}** has exactly **2** entries
the hub does not show two dynamically registered peers

How it was checked

R2 show running-config interface Tunnel0

Building configuration...

```

Teardown (suite) Restore Nhrp, Close All Connections

4.05 PASS This Is Phase 3, Not Phase 1 Or 2 (0.1s, 3 commands)

Redirect on the hub and shortcut on the spokes are what make the overlay reorganise itself. Without them the tests below about direct paths cannot pass, and the design is a different one.

Setup (suite) Open All Routers

Acceptance criteria

- output contains **ip nhrp redirect**
the hub sends no NHRP redirects
- output contains **ip nhrp nhs** (checked 2x)

How it was checked

Teardown (suite) Restore Nhrp, Close All Connections

4.06 PASS Both Spokes Register With The Hub (0.0s, 1 commands)

Registration is dynamic: the hub is configured with no spoke addresses at all and learns them as they arrive.

Setup (suite) Open All Routers

Acceptance criteria

- output matches `${WAN_IP}${r}}\s+${DMVPN_IP}${r}}\s+UP` (checked 2x)
 - `${dynamic}` has exactly 2 entries
- the hub does not show two dynamically registered peers

How it was checked

R1 show dmvpn

```

Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
N - NATed, L - Local, X - No Socket
T1 - Route Installed, T2 - Nexthop-override, B - BGP

Teardown (suite) Restore Nhrp, Close All Connections

4.09 PASS A Spoke Learns The Far Spoke As The BGP Next Hop (0.1s, 2 commands)

The routing half of Phase 3, and the reason "next-hop-unchanged" is configured on the hub. If the hub rewrote the next hop to itself, every spoke-to-spoke prefix would resolve to the hub, NHRP would never be asked to find the far spoke, and no shortcut could form.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${R3_DMVPN_IP}`
R2 does not see R3's tunnel address as the next hop for R3's prefix
- output contains `${R2_DMVPN_IP}`
R3 does not see R2's tunnel address as the next hop for R2's prefix

How it was checked

R2 show bgp ipv4 unicast 10.20.3.1

Teardown (suite) Restore Nhrp, Close All Connections

4.10 PASS Spoke To Spoke Traffic Works Before Any Shortcut Exists (12.1s, 4 commands)

The fallback path. With the NHRP cache cleared there is no direct entry, so the first packets go through the hub -- which is what makes the shortcut an optimisation rather than a prerequisite for connectivity.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain `${WAN_IP}${peer}}`
- output contains **Success rate is**
- `${loss}[0] > 0` holds

How it was checked

R2 clear ip nhrp

```
${output} =
```

R3 clear ip nhrp

```
${output} =
```

R2 show ip nhrp 172.20.0.3

```
${output} =
```

R2 ping 10.20.3.1 source Loopback1 repeat 30

```
Type escape sequence to abort.
Sending 30, 100-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
.....
Success rate is 96 percent (29/30), round-trip min/avg/max = 1/1/2 ms
```

Teardown (suite) Restore Nhrp, Close All Connections

4.11 PASS A Shortcut Forms On Demand (12.2s, 6 commands)

The defining behaviour. Cleared first so the entry cannot be left over from an earlier test: it has to be created by this traffic, here.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain `${WAN_IP}${peer}}`
- output contains `${WAN_IP}${peer}}` (checked 2x)

How it was checked

R2 clear ip nhrp

```
${output} =
```

R3 clear ip nhrp

```
${output} =
```

R2 show ip nhrp 172.20.0.3

```
${output} =
```

R2 ping 10.20.3.1 source Loopback1 repeat 20

```
Type escape sequence to abort.
Sending 20, 100-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
.....
Success rate is 95 percent (19/20), round-trip min/avg/max = 1/1/2 ms
```

```

R2 show ip nhrp 172.20.0.3
172.20.0.3/32 via 172.20.0.3
  Tunnel0 created 00:00:02, expire 00:04:58
  Type: dynamic, Flags: router nhop bfd
  NBMA address: 100.64.0.3

R3 show ip nhrp 172.20.0.2
172.20.0.2/32 via 172.20.0.2
  Tunnel0 created 00:00:02, expire 00:04:57
  Type: dynamic, Flags: router implicit nhop bfd
  NBMA address: 100.64.0.2

```

Teardown (suite) Restore Nhrp, Close All Connections

4.12 PASS Traffic Then Leaves The Hub Out Of The Path (0.1s, 2 commands)

The point of the shortcut, and the strongest statement this suite makes: with the direct path installed, a trace from one spoke to the other reaches it in a single hop instead of transiting the hub.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${WAN_IP}${peer}}`
 - output contains `${R3_DMVPN_IP}`
 - output does not contain `${R1_DMVPN_IP}`
- the trace still passes through the hub, so no shortcut is in use:\n\${trace}
- `${hops}[-1]` equals 1
- the far spoke is `${hops}[-1]` hops away, expected 1

How it was checked

```

R2 show ip nhrp 172.20.0.3
172.20.0.3/32 via 172.20.0.3
  Tunnel0 created 00:00:02, expire 00:04:57
  Type: dynamic, Flags: router nhop bfd
  NBMA address: 100.64.0.3

R2 traceroute 10.20.3.1 source Loopback1 probe 1 timeout 1 numeric
Type escape sequence to abort.
Tracing the route to 10.20.3.1
VRF info: (vrf in name/id, vrf out name/id)
 1 172.20.0.3 1 msec

```

Teardown (suite) Restore Nhrp, Close All Connections

4.13 PASS The Shortcut Gets Its Own IPsec Session (0.1s, 2 commands)

A direct path between two routers that were never configured with each other's addresses, protected all the same, because the profile is bound to the tunnel rather than to a peer.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${WAN_IP}${peer}}`
 - output contains `${R3_WAN_IP}`
- R2 has no IPsec session with R3's NBMA address:\n\${sess}
- `${count}` has exactly 2 entries
- R2 holds `${count}` tunnel sessions, expected one to the hub and one to R3

How it was checked

```

R2 show ip nhrp 172.20.0.3
172.20.0.3/32 via 172.20.0.3
  Tunnel0 created 00:00:02, expire 00:04:57
  Type: dynamic, Flags: router nhop bfd
  NBMA address: 100.64.0.3

R2 show crypto session brief

```

Teardown (suite) Close Nms, Close All Connections

5.10 PASS Capture Collector State From The NMS (0.3s, 12 commands)

What the collectors actually hold: the tail of each router's syslog file and of snmptrapd's decrypted log. This is the management-plane evidence that used to come off h1.

Setup (suite) Open All Routers, Open All Hosts, Open Nms

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked

NMS systemctl is-active rsyslog snmptrapd lab-trapcap

```
active
active
active
```

NMS systemctl is-active rsyslog snmptrapd lab-trapcap

```
active
active
active
```

NMS sudo ls -l /var/log/lab

```
total 8724

R1 no monitor capture ROBOTCAP
\${output} =

Teardown (suite) Run Keyword And Ignore Error, Delete Capture, R1, Close All Routers

6.02 PASS Protected Endpoint Addresses Never Appear In Cleartext On The Link (15.7s, 9 commands)

The strongest statement this lab can make about encryption: traffic between the loopbacks crosses the wire without either loopback address being visible, and with no cleartext ICMP.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain `${R1_LOOPBACK}`
- output does not contain `${R2_LOOPBACK}`
- output does not contain **ICMP**

How it was checked

R1 no monitor capture ROBOTCAP
Capture does not exist

R1 monitor capture ROBOTCAP interface GigabitEthernet2 both

```

${output} =
R1 monitor capture ROBOTCAP match ipv4 any any
${output} =
R1 monitor capture ROBOTCAP buffer size 5
${output} =
R1 monitor capture ROBOTCAP start
Started capture point : ROBOTCAP
R1 ping 172.16.2.1 source Loopback0 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.2.1, timeout is 2 seconds:
Packet sent with a source address of 172.16.1.1
.....
Success rate is 0 percent (0/5)
R1 monitor capture ROBOTCAP stop
Stopped capture point : ROBOTCAP
R1 show monitor capture ROBOTCAP buffer brief
-----
#    size    timestamp    source            destination        dscp    protocol

Teardown (this test) Restore Default SA Lifetime

08 Management Api

8.01 PASS RESTCONF Reports The Same Hostname As The CLI (0.4s, 3 commands)

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- output contains `${name}` (checked 3×)

How it was checked

```
R1 show running-config | include ^hostname
hostname c8000v-r1
```

```
R2 show running-config | include ^hostname
hostname c8000v-r2
```

```
R3 show running-config | include ^hostname
hostname c8000v-r3
```

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

8.02 PASS RESTCONF Interface State Agrees With The CLI (0.1s, 1 commands)

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- `${status}` equals up
- output matches `GigabitEthernet2` is `${R1_WAN_IP}` is YES is `IS` is `up` is `up`

How it was checked

```
R1 show ip interface brief GigabitEthernet2
Interface      IP-Address      OK? Method Status          Protocol
GigabitEthernet2  100.64.0.1      YES NVRAM  up              up
```

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

8.03 PASS Config Pushed Over RESTCONF Appears In The CLI (0.3s, 1 commands)

Write path plus cross-check: RESTCONF and the CLI must be two views of one datastore, not two datastores.

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- `${resp.status_code}` in (201, 204) holds
- output contains `${RC_LOOPBACK_IP}`

How it was checked

```
R1 show running-config interface Loopback200
Building configuration...

Current configuration : 68 bytes
!
interface Loopback200
 ip address 198.51.100.1 255.255.255.0
end
```

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

8.04 PASS Config Deleted Over RESTCONF Disappears From The CLI (0.8s, 1 commands)

Runs after the PUT test, which creates the interface; a 404 here would mean the create silently failed.

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- `${resp.status_code}` equals 204
- RESTCONF DELETE returned `${resp.status_code}`; expected 204 for the loopback created by the previous test
- output does not contain `${RC_LOOPBACK_IP}`

How it was checked

```
R1 show ip interface brief Loopback200
```

```
^  
% Invalid input detected at '^' marker.
```

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

8.05 **PASS** NETCONF Reports The Same Hostname As The CLI (0.8s, 1 commands)

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- `${name}` equals `${R1_NAME}`
- output contains `${name}`

How it was checked

```
R1 show running-config | include ^hostname  
hostname c8000v-r1
```

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

8.06 **PASS** NETCONF Advertises The Expected Base Capabilities (0.5s, 0 commands)

IOS-XE does not list per-module URIs such as Cisco-IOS-XE-native in the hello; modules are exposed via yang-library. That the native model is usable is proven by the hostname test above, which queries the native namespace directly.

Setup (suite) Open All Routers, Create RESTCONF Sessions

Acceptance criteria

- `${hit}` is not empty (checked 3×)

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Run Keyword And Ignore Error, Delete RESTCONF Loopback, Close All Routers

09 Bgp

9.01 PASS BGP Sessions Are Established With The Expected Peer AS (0.1s, 4 commands)

The hub holds one session per spoke; each spoke holds exactly one.

Setup (suite) Establish BGP

Acceptance criteria

- output matches `${peer}\s+4\s+${peer_asn}(\s+ld+){5}\s+!S+\s+ld+` (checked 4x)

How it was checked

```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.05 PASS BGP Uses BFD For Fall-over On Every Peer (0.4s, 6 commands)

A BFD session that no protocol consumes would detect failures and change nothing, so this checks BGP is the registered client rather than just that BFD is running.

Setup (suite) Establish BGP

Acceptance criteria

- `${remote}` matches `${bfd}` exactly (checked 3×)
- `msg=${r}: neighbours ${remote} but only ${bfd} use BFD fall-over`
- output does not contain **Down** (checked 3×)

How it was checked

R1 `show running-config | include ^ neighbor .* remote-as|fall-over bfd`

```
neighbor 172.20.0.2 remote-as 65002
neighbor 172.20.0.2 fall-over bfd
neighbor 172.20.0.3 remote-as 65003
neighbor 172.20.0.3 fall-over bfd
```

R1 `show bfd neighbors client bgp`

```
IPv4 Sessions
NeighAddr          LD/RD          RH/RS    State    Int
172.20.0.2          4098/4112      Up       Up       Tu0
172.20.0.3          4097/4097      Up       Up       Tu0
```

R2 `show running-config | include ^ neighbor .* remote-as|fall-over bfd`

```
neighbor 172.20.0.1 remote-as 65001
neighbor 172.20.0.1 fall-over bfd
```

R2 `show bfd neighbors client bgp`

```
IPv4 Sessions
NeighAddr          LD/RD          RH/RS    State    Int

neighbor 172.20.0.1 fall-over bfd
```

```
R3 show bfd neighbors client bgp
```

```
IPv4 Sessions
NeighAddr          LD/RD          RH/RS    State    Int
172.20.0.1         4097/4097      Up       Up       Tu0
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.06 PASS BFD Tears The Session Down Long Before The Hold Time (12.7s, 26 commands)

The test that makes BFD more than configuration. An ACL on the hub's tunnel drops only BFD control packets (UDP 3784 and 3785) and leaves BGP's TCP session untouched, so ordinary BGP liveness is unaffected. Without fall-over the session would survive until the 30s hold time expires; with it, BFD declares the peer down in about a second and BGP follows.

Setup (suite) Establish BGP

Acceptance criteria

- output matches `${peer}%s+4%${peer_asn}(%s+1d+){5}%s+1S+1s+1d+` (checked 4×)
- output does not match `^1d+$` (checked 3×)
- `${elapsed} < ${HOLD_TIME}` holds
- output contains **Known via "bgp** (checked 2×)

How it was checked

```
R1 show bgp ipv4 unicast summary
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.07 **PASS** Every Peer Has An Outbound Route-map Over Per-class Prefix-lists (0.6s, 13 commands)

One prefix-list per prefix class, and a route-map clause per class so each can carry its own community. The clauses are the whitelist: the route-map's implicit deny is what stops anything unnamed being advertised.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **RM-OUT- $\{peer\}$** (checked 4×)
- output contains **PL-OWN- $\{cls\}$** (checked 9×)

How it was checked

```
R2 show running-config | include route-map RM-OUT-R2 out
neighbor 172.20.0.2 route-map RM-OUT-R2 out
```

```
R3 show running-config | include route-map RM-OUT-R3 out
neighbor 172.20.0.3 route-map RM-OUT-R3 out
```

```
R1 show ip prefix-list PL-OWN-L0
ip prefix-list PL-OWN-L0: 1 entries
seq 5 permit 10.20.1.1/32
```

```
R1 show ip prefix-list PL-OWN-NAT
ip prefix-list PL-OWN-NAT: 1 entries
seq 5 permit 10.30.1.0/24
```

```
R1 show ip prefix-list PL-OWN-LAN
ip prefix-list PL-OWN-LAN: 1 entries
seq 5 permit 192.168.10.0/24
```

```
R1 show running-config | include route-map RM-OUT-R1 out
neighbor 172.20.0.1 route-map RM-OUT-R1 out
```

```
R2 show ip prefix-list PL-OWN-L0
ip prefix-list PL-OWN-L0: 1 entries
seq 5 permit 10.20.2.1/32
```

```
R2 show ip prefix-list PL-OWN-NAT
ip prefix-list PL-OWN-NAT: 1 entries
seq 5 permit 10.30.2.0/24
```

```
R2 show ip prefix-list PL-OWN-LAN
ip prefix-list PL-OWN-LAN: 1 entries
seq 5 permit 192.168.20.0/24
```

```
R1 show running-config | include route-map RM-OUT-R1 out
neighbor 172.20.0.1 route-map RM-OUT-R1 out
```

```
R3 show ip prefix-list PL-OWN-L0
ip prefix-list PL-OWN-L0: 1 entries
seq 5 permit 10.20.3.1/32
```

```
R3 show ip prefix-list PL-OWN-NAT
ip prefix-list PL-OWN-NAT: 1 entries
seq 5 permit 10.30.3.0/24
```

```
R3 show ip prefix-list PL-OWN-LAN
ip prefix-list PL-OWN-LAN: 1 entries
seq 5 permit 192.168.30.0/24
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.08 **PASS** Every Peer Has An Inbound Policy Matching Community And AS Path (0.6s, 11 commands)

*Both matches sit in one permit clause, so they are ANDed and the clause's implicit deny is the drop: a prefix with an unknown community *or* an unexpected AS path falls through.*

Setup (suite) Establish BGP

Acceptance criteria

- output contains **RM-IN- $\{peer\}$** (checked 4×)
- output contains **community (community-list filter): CL-VALID** (checked 4×)
- output matches **as-path (as-path filter): $\{id\}^+$** (checked 4×)
- **$\{entries\}$** has exactly **9** entries (checked 3×)

How it was checked

```
R2 show running-config | include route-map RM-IN-R2 in
neighbor 172.20.0.2 route-map RM-IN-R2 in
```

R2 show route-map RM-IN-R2

```
route-map RM-IN-R2, permit, sequence 10
Match clauses:
  as-path (as-path filter): 10
  community (community-list filter): CL-VALID
Set clauses:
Policy routing matches: 0 packets, 0 bytes
```

```
R3 show running-config | include route-map RM-IN-R3 in
neighbor 172.20.0.3 route-map RM-IN-R3 in
```

R3 show route-map RM-IN-R3

```
route-map RM-IN-R3, permit, sequence 10
Match clauses:
  as-path (as-path filter): 20
  community (community-list filter): CL-VALID
Set clauses:
Policy routing matches: 0 packets, 0 bytes
```

R1 show ip community-list CL-VALID

```
Named Community standard list CL-VALID
permit 65001:1
permit 65001:2
permit 65001:3
permit 65002:1
permit 65002:2
permit 65002:3

Teardown (suite) Restore BGP Baseline, Close All Routers

9.10 PASS Re-advertised Prefixes Keep Their Origin Community Through The Hub (0.1s, 4 commands)

A spoke-to-spoke prefix crosses the hub, which re-advertises it. If the hub re-tagged it the community would say 65001 and the origin would be lost, so this asserts the far spoke's own community survives the hop.

Setup (suite) Establish BGP

Teardown (suite) Restore BGP Baseline, Close All Routers

9.11 PASS A Prefix With An Unknown Community Is Rejected Inbound (31.1s, 41 commands)

*The prefix is explicitly permitted *outbound* by a temporary clause, so the outbound whitelist cannot be what stops it -- only the inbound community match can. The test asserts R2 really did advertise it before asserting R1 refused it, otherwise it would pass whenever the advertisement failed.*

Setup (suite) Establish BGP

Acceptance criteria

- output contains **#{BAD_COMM_ADDR}** (checked 7×)
R2 is not yet advertising the test prefix
- output contains **#{BAD_COMM_ADDR}**
R2 never advertised the prefix, so this proves nothing about the inbound policy
- output contains **Network not in table**
the hub accepted a prefix carrying community **#{UNKNOWN_COMM}**

Teardown (this test) Remove Test Prefix From R2

9.12 PASS Every Peer Has A Maximum-prefix Limit With Headroom (0.5s, 6 commands)

Filtering controls what a peer may send; this controls how much. The limit must sit above normal load or it would trip in steady state -- a hub holds 3 prefixes per spoke, a spoke 6 -- and far below anything that could exhaust memory.

Setup (suite) Establish BGP

Acceptance criteria

- `#{remote}` matches `#{limited}` exactly (checked 3×)
msg=`{r}`: neighbours `{remote}` but only `#{limited}` have a maximum-prefix
- `#{n} < #{MAX_PREFIX}` holds (checked 3×)

How it was checked

R1 show running-config | include ^ neighbor .* remote-as|maximum-prefix

```
neighbor 172.20.0.2 remote-as 65002
neighbor 172.20.0.3 remote-as 65003
neighbor 172.20.0.2 maximum-prefix 15 80
neighbor 172.20.0.3 maximum-prefix 15 80
```

R1 show bgp ipv4 unicast summary | begin Neighbor

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.2	4	65002	19	16	82	0	0	00:01:03	3
172.20.0.3	4	65003	13	16	82	0	0	00:01:00	3

R2 show running-config | include ^ neighbor .* remote-as|maximum-prefix

```
neighbor 172.20.0.1 remote-as 65001
neighbor 172.20.0.1 maximum-prefix 15 80
```

R2 show bgp ipv4 unicast summary | begin Neighbor

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.1	4	65001	16	19	83	0	0	00:01:03	6

R3 show running-config | include ^ neighbor .* remote-as|maximum-prefix

```
neighbor 172.20.0.1 remote-as 65001
neighbor 172.20.0.1 maximum-prefix 15 80
```

R3 show bgp ipv4 unicast summary | begin Neighbor

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
172.20.0.1	4	65001	16	13	434	0	0	00:01:00	6

Teardown (suite) Restore BGP Baseline, Close All Routers

9.13 PASS A Peer That Floods Prefixes Is Torn Down Rather Than Absorbed (32.0s, 343 commands)

R2 originates 20 extra prefixes, tagged with a valid community and carrying a valid AS path, and explicitly permitted outbound -- so neither the whitelist, the community match nor the AS-path filter can be what stops them. Only the prefix count is left. The hub must drop the session instead of accepting an unbounded table.

Setup (suite) Establish BGP

Acceptance criteria

- output does not match `^ld+$` (checked 6×)
- output contains **PfxCt**
the session went down, but not because of the prefix count: `{state}`
- output contains `{R2_TUNNEL_LOCAL}`
the hub logged no maximum-prefix violation for `{R2_TUNNEL_LOCAL}`

How it was checked

Teardown (this test) Stop Flooding From R2

9.14 PASS The Session Recovers Once The Flood Stops (30.3s, 9 commands)

A maximum-prefix teardown is deliberately sticky -- no "restart" is configured -- so recovery takes an operator clearing it. This asserts the lab returns to a converged state rather than leaving the next suite a broken topology.

Setup (suite) Establish BGP

Acceptance criteria

- output matches `${peer}\s+4\s+${peer_asn}(\s+1d+){5}\s+1S+1s+1d+` (checked 3×)
- output contains **Known via "bgp"** (checked 6×)

How it was checked

```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.15 PASS A Prefix With An Invalid AS Path Is Rejected Inbound (10.9s, 38 commands)

Same prefix, this time with a valid community but an AS path this topology cannot produce. Only the AS-path match differs, so a rejection here isolates that filter.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **#{BAD_COMM_ADDR}** (checked 3×)
R2 is not yet advertising the test prefix
- output contains **#{BAD_COMM_ADDR}**
R2 never advertised the prefix, so this proves nothing about the inbound policy
- output contains **Network not in table**
the hub accepted a prefix whose AS path contained **#{BOGUS_AS}**

How it was checked

Teardown (this test) Remove Test Prefix From R2

9.16 PASS Each Peer Is Advertised Exactly Its Whitelisted Prefixes (0.3s, 4 commands)

Not "at least" -- exactly. A whitelist that permits more than intended still passes a containment check, so the advertised set is compared for equality against what the peer should get: a spoke sends only its own prefixes, the hub sends its own plus the far spoke's.

Setup (suite) Establish BGP

Acceptance criteria

- **`\${actual}`** matches **`\${expected}`** exactly (checked 4×)
- msg=**`\${from}`** advertises **`\${actual}`** to **`\${to}`**, expected **`\${expected}`**

How it was checked

Teardown (suite) Restore BGP Baseline, Close All Routers

9.17 PASS A Prefix Outside The Whitelist Is Not Advertised (10.5s, 20 commands)

The point of a whitelist. A spoke originates a prefix nobody authorised; it appears in that spoke's own BGP table, so the origination worked, and must still never reach the hub.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **\${OFF_LIST_ADDR}**
R2 never originated the prefix, so this test proves nothing
- output does not contain **\${OFF_LIST_ADDR}/32**
R2 advertised an unlisted prefix to the hub
- output contains **Network not in table**
an unlisted prefix reached the hub

Teardown (suite) Restore BGP Baseline, Close All Routers

9.19 PASS Peer Prefix Is Learned Via BGP And Not A Static Route (0.0s, 1 commands)

Distinguishes a genuinely BGP-installed route from one that merely happens to exist. eBGP is distance 20; a static is 1.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **Known via "bgp \${R1_ASN}"**
- output contains **distance 20**
- output contains **type external**

How it was checked

R1 show ip route 10.20.2.1

```
Routing entry for 10.20.2.1/32
  Known via "bgp 65001", distance 20, metric 0
  Tag 65002, type external
  Last update from 172.20.0.2 00:00:43 ago
  Routing Descriptor Blocks:
    * 172.20.0.2, from 172.20.0.2, 00:00:43 ago
      opaque_ptr 0x71FE1BFD8DB8
```

```
Route metric is 0, traffic share count is 1
AS Hops 1
Route tag 65002
MPLS label: none
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.20 **PASS** BGP Route Resolves Out The Encrypted Tunnel (0.0s, 1 commands)

The next hop is a tunnel address, so the forwarding path must recurse to Tunnel0 rather than the cleartext link.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **`{R2_TUNNEL_LOCAL}`**
- output contains **`Tunnel0`**

How it was checked

```
R1 show ip cef 10.20.2.1
10.20.2.1/32
  nexthop 172.20.0.2 Tunnel0
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.21 **PASS** Traffic Over The BGP-Learned Route Reaches The Peer (0.0s, 1 commands)

End to end: this only succeeds because BGP installed the route.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **`Success rate is 100 percent`**

How it was checked

```
R1 ping 10.20.2.1 source Loopback1 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.20.2.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.1.1
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/3 ms
```

Teardown (suite) Restore BGP Baseline, Close All Routers

9.22 **PASS** BGP-Routed Traffic Is Encrypted (5.7s, 7 commands)

Setup (suite) Establish BGP

Acceptance criteria

- output contains **`Success rate is 100 percent`**
- **`{r1_enc} >= {expected}`** holds (checked 2×)
- **`{r1_dec} >= {expected}`** holds (checked 2×)
- **`{r2_enc} >= {expected}`** holds (checked 2×)
- **`{r2_dec} >= {expected}`** holds (checked 2×)

Teardown (suite) Restore BGP Baseline, Close All Routers

9.24 PASS Withdrawing A Prefix Removes It From The Peer (55.4s, 22 commands)

Shuts the advertised interface on R2 and requires R1 to lose both the BGP path and the route, then restores it.

Setup (suite) Establish BGP

Acceptance criteria

- output contains **% Subnet not in table** (checked 6×)
- output contains **Known via "bgp** (checked 8×)

How it was checked

R2 configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

R2 interface Loopback1

\${output} =

Teardown (suite) Run Keyword And Ignore Error, Delete Capture, R1, HOSTCAP, Close All Connections

10.09 PASS Spoke To Spoke Traffic Is Encrypted On The Direct Path (11.6s, 11 commands)

The VTI lab this mirrors captured the hub's second link, because h2 to h3 crossed two tunnels and was decrypted and re-encrypted in between. Under DMVPN there is no second leg to capture: once the shortcut forms the hub is not on the path at all, so the capture moves to the spoke's own WAN interface -- the only place that traffic now appears. It should be ESP there, with neither host address visible.

Setup (suite) Open All Routers, Open All Hosts, Wait For LAN Routes, Warm Up Host Paths

Acceptance criteria

- output contains **#{R3_WAN_IP}**
R2 has not resolved R3 directly, so no shortcut is in place
- output contains , **0% packet loss**
ping from **#{alias}** to **#{target}** lost packets: **#{out}**
- output contains **ESP**
- output does not contain **#{H2_IP}**
- output does not contain **#{H3_IP}**
- output does not contain **ICMP**

R2 no monitor capture HOSTCAP

```

${output} =

```

Teardown (suite) Run Keyword And Ignore Error, Delete Capture, R1, HOSTCAP, Close All Connections

10.10 **PASS** The Hub Is Not On The Spoke To Spoke Path (0.0s, 2 commands)

The routing consequence of the shortcut, from the hosts' point of view rather than the routers'.

Setup (suite) Open All Routers, Open All Hosts, Wait For LAN Routes, Warm Up Host Paths

Acceptance criteria

- output contains **`\${R3\_WAN\_IP}`**
R2 has not resolved R3 directly, so no shortcut is in place
- output does not contain **`\${R1\_DMVPN\_IP}`**
host traffic between the spokes still transits the hub:\n`\${trace}`

How it was checked

R2 show ip nhrp 172.20.0.3

```

172.20.0.3/32 via 172.20.0.3
  Tunnel0 created 00:01:26, expire 00:03:33
  Type: dynamic, Flags: router nhop bfd
  NBMA address: 100.64.0.3

```

H2 traceroute -n -q 1 -w 1 192.168.30.10

```

traceroute to 192.168.30.10 (192.168.30.10), 30 hops max, 60 byte packets
 1  192.168.20.1    0.964 ms
 2  172.20.0.3     1.125 ms
 3  192.168.30.10  2.601 ms

```

Teardown (suite) Run Keyword And Ignore Error, Delete Capture, R1, HOSTCAP, Close All Connections

11 Throughput

11.01 **PASS** Hub To Spoke Hosts Sustain The Target Throughput (32.0s, 2 commands)

h1 -> h2 crosses one tunnel.

Setup (suite) Open All Routers, Open All Hosts, Wait For Fabric

Acceptance criteria

- `${m}` is not empty
- `${mbps} >= ${TP_TARGET}` holds

How it was checked

```
H1 nc -l -p 5001 > /dev/null 2>&1 &
${output} =
```

```
H1 S=$(date +%s); dd if=/dev/zero bs=64k count=1024 2>/dev/null | nc -w 1 192.168.20.10 5001; echo SECS=$(( $(date +%s) - S ))
SECS=31
```

Teardown (suite) Close All Connections

11.02 **PASS** Spoke To Spoke Hosts Sustain The Target Throughput (32.0s, 2 commands)

h2 -> h3 crosses two tunnels, being decrypted and re-encrypted at the hub, so it is the more demanding path.

Setup (suite) Open All Routers, Open All Hosts, Wait For Fabric

Acceptance criteria

- `${m}` is not empty
- `${mbps} >= ${TP_TARGET}` holds

How it was checked

```
H2 nc -l -p 5001 > /dev/null 2>&1 &
${output} =
```

```
H2 S=$(date +%s); dd if=/dev/zero bs=64k count=1024 2>/dev/null | nc -w 1 192.168.30.10 5001; echo SECS=$(( $(date +%s) - S ))
SECS=31
```

Teardown (suite) Close All Connections

11.03 **PASS** Bulk Throughput Traffic Is Encrypted (17.3s, 6 commands)

Rate alone says nothing about protection. A transfer of this size must move thousands of packets through ESP, so assert the counters rose in proportion to the bytes actually sent.

Setup (suite) Open All Routers, Open All Hosts, Wait For Fabric

Acceptance criteria

- `${m}` is not empty
- `${data_out} >= ${expected}` holds
- `${data_in} >= ${expected}` holds
- `${ack_in} > 0` holds
- `${ack_out} > 0` holds

```

Teardown (suite) Close All Connections

13.07 PASS A Thirty-first Client Gets No Translation Once The Pool Is Exhausted (4.3s, 7

commands)

The boundary the pool sizing never otherwise reaches. The pool holds exactly as many addresses as there are clients, which means the exhaustion path is never exercised by a normal run -- and an off-by-one in pool bounds would look identical to a correct configuration. So bring up one more client inside the pool ACL and require the router to refuse it: no translation, no borrowing of another client's address, and the miss counted. Without "overload" there is nothing to share, so silently reusing an address would be a correctness bug, not graceful degradation. Run against R1/H1, because it is R1's pool that the tests above fill: the suite drives traffic from H1 first and only reaches the other routers later. Asserting exhaustion on a router whose pool is still empty would test nothing.

Setup (suite) Open All Routers, Open All Hosts, Wait For NAT Routes, Reset Translations

Acceptance criteria

- output contains **allocated 30 (100%)**
- **\${n}** is not empty (checked 2×)
- output contains **100% packet loss**
the thirty-first client was translated even though the pool was exhausted
- **\${xlate}** is empty
- **\${after} > \${before}** holds

Teardown (suite) Close All Connections

13.09 PASS Static And Pool Translations Coexist Across The Whole Block (0.5s, 1 commands)

All 40 of a host's addresses in flight, translated by two different mechanisms, with no outside address reused.

Setup (suite) Open All Routers, Open All Hosts, Wait For NAT Routes, Reset Translations

Acceptance criteria

- **\${all}** has exactly **40** entries
expected 40 translated addresses, found \${all}
- **\${d}** equals **40**
the 40 inside addresses did not receive 40 distinct outside addresses

How it was checked

Teardown (suite) Close All Connections

13.11 PASS Only The Static Mappings Live In The Configuration (0.1s, 1 commands)

Static mappings are configuration and survive a reload; pool allocations are runtime state and do not. Confusing the two is how NAT surprises people after a reboot.

Setup (suite) Open All Routers, Open All Hosts, Wait For NAT Routes, Reset Translations

Acceptance criteria

- output contains **static** `${H1_IP} ${H1_NAT_IP}`
- output does not contain `${NAT24}[R1].${POOL_OCTET_FIRST}`
- output contains **ip nat inside source list** `NAT-POOL-SRC pool SITE-POOL`

How it was checked

R1 show running-config | include ip nat inside source

```
ip nat inside source static 192.168.10.10 10.30.1.10 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.11 10.30.1.11 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.12 10.30.1.12 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.13 10.30.1.13 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.14 10.30.1.14 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.15 10.30.1.15 route-map NAT-TO-DOMAIN
ip nat inside source static 192.168.10.16 10.30.1.16 route-map NAT-TO-DOMAIN

```

Teardown (suite) Close Nms Session, Close All Connections

14.02 PASS The NMS Itself Synchronises To The Public Pool (2.4s, 2 commands)

The precondition the rest of this suite rests on. chrony is configured "local stratum 10", so it serves time whether or not it has an upstream -- meaning the routers can agree perfectly on time that came from nowhere. This requires a real upstream: a reference that is not the local clock, and a stratum that proves it came from somewhere else.

Setup (suite) Open All Routers

Acceptance criteria

- output does not contain **7F7F0101**
the NMS is serving its own local clock, so lab time is fabricated
- **\${m}** is not empty
- **0 < \${m}[0] < \${MAX_STRATUM}** holds
- output matches **^*!s+!d+!l.d+!l.d+!l.d+**
the NMS has selected no upstream source: \${sources}

How it was checked

NMS chronyc tracking

```
Reference ID      : C0CF37FE (192.207.55.254)

Teardown (suite) Close Nms Session, Close All Connections

14.03 PASS Every Router Appears As A Client Of The NMS (0.1s, 1 commands)

Seen from the server, which is where a missing client shows up as an absence rather than as a router quietly using something else.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${r}_OOB_IP` (checked 3×)

How it was checked

NMS `sudo chronyc clients`

Hostname	NTP	Drop	Int	IntL	Last	Cmd	Drop	Int	Last
192.168.99.2	755	0	6	-	930	0	0	-	-
192.168.99.3	694	0	5	-	397	0	0	-	-
192.168.99.1	537	0	6	-	397	0	0	-	-
localhost	0	0	-	-	-	24	0	10	0

Teardown (suite) Close Nms Session, Close All Connections

14.04 PASS Every Router Forms Associations With Pool Servers (0.1s, 3 commands)

Setup (suite) Open All Routers

Acceptance criteria

- `${rows}` is not empty (checked 3×)

How it was checked

R1 `show ntp associations`

```
address      ref clock      st  when  poll reach delay offset disp
*~192.168.99.10 192.207.55.254 2    397  1024  377 0.089 -13.645 1.071

* sys.peer, # selected, + candidate, - outlyer, x falseticker, ~ configured
```

Teardown (suite) Close Nms Session, Close All Connections

14.07 PASS Every Router Clock Is Synchronised (0.1s, 3 commands)

The end state: IOS declares the clock synchronised. This lags real accuracy by a long way. IOS holds the flag back until its loopfilter leaves the 'FREQ' drift-measurement phase, measured on this platform at about 17 minutes from a cold NTP start -- while the offset is already within milliseconds well before that. The wait below is bounded to cover a freshly provisioned lab; on a lab that has been up it returns on the first poll and costs nothing.

Setup (suite) Open All Routers

Acceptance criteria

- output contains **Clock is synchronized** (checked 3×)

How it was checked

R1 show ntp status

```
Clock is synchronized, stratum 3, reference is 192.168.99.10
nominal freq is 250.0000 Hz, actual freq is 250.0019 Hz, precision is 2**10
ntp uptime is 5092300 (1/100 of seconds), resolution is 4000
reference time is EE4A788A.E41895E8 (12:05:30.891 UTC Tue Sep 8 2026)
clock offset is -13.6455 msec, root delay is 52.12 msec
root dispersion is 211.34 msec, peer dispersion is 1.07 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.000007850 s/s
system poll interval is 1024, last update was 13073 sec ago.
```

R2 show ntp status

```
Clock is synchronized, stratum 3, reference is 192.168.99.10
nominal freq is 250.0000 Hz, actual freq is 250.0022 Hz, precision is 2**10
ntp uptime is 5092400 (1/100 of seconds), resolution is 4000
reference time is EE4A9DAD.03D70A48 (14:43:57.015 UTC Tue Sep 8 2026)
clock offset is 0.8446 msec, root delay is 51.49 msec
root dispersion is 57.95 msec, peer dispersion is 1.09 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.000008873 s/s
system poll interval is 1024, last update was 3566 sec ago.
```

R3 show ntp status

```
Clock is synchronized, stratum 3, reference is 192.168.99.10
nominal freq is 250.0000 Hz, actual freq is 250.0020 Hz, precision is 2**10
ntp uptime is 5092300 (1/100 of seconds), resolution is 4000
reference time is EE4AA7F2.49FBE838 (15:27:46.289 UTC Tue Sep 8 2026)
clock offset is -5.1622 msec, root delay is 51.49 msec
root dispersion is 21.19 msec, peer dispersion is 1.08 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.000007971 s/s
system poll interval is 512, last update was 937 sec ago.
```

Teardown (suite) Close Nms Session, Close All Connections

14.08 PASS Stratum Is Sane On Every Router (0.1s, 3 commands)

Stratum 16 means unsynchronised. A client of a stratum 1-2 pool server should land well below the limit.

Setup (suite) Open All Routers

Acceptance criteria

- `${m}` is not empty (checked 3×)
- `${m}[0] < ${MAX_STRATUM}` holds (checked 3×)

How it was checked

R1 show ntp status

```
Clock is synchronized, stratum 3, reference is 192.168.99.10
nominal freq is 250.0000 Hz, actual freq is 250.0019 Hz, precision is 2**10

Teardown (suite) Close Nms Session, Close All Connections

15 Syslog

15.01 **PASS** The Collector Is A Service On The NMS Serving Every Router On One Port (0.1s, 2 commands)

What the move bought: one rsyslog listener for all three routers instead of one busybox listener per router, and a system service rather than something a suite starts -- so no run can leave a stale listener swallowing another's messages.

Setup (suite) Start Collector And Routers

Acceptance criteria

- `${state}` equals **active**
- output contains `:${SYSLOG_PORT}`
- output contains **rsyslogd**

How it was checked

NMS `systemctl is-active rsyslog`
active

NMS `sudo ss -ltnp | grep ':514 ' || echo NONE`

UNCONN	0	0	0.0.0.0:514	0.0.0.0:*	users:("rsyslogd",pid=1126,fd=6))
UNCONN	0	0	:::514	:::*	users:("rsyslogd",pid=1126,fd=7))

Teardown (suite) Close Collector, Close All Connections

15.02 **PASS** Every Router Is Configured To Log To The Collector (0.4s, 3 commands)

Setup (suite) Start Collector And Routers

Acceptance criteria

- output contains **logging host** `${SYSLOG_HOST}` (checked 3×)
- output contains **logging source-interface** `${OOB_INTF}${r}` vrf `${MGMT_VRF}` (checked 3×)
- output contains **service sequence-numbers** (checked 3×)

How it was checked

R1 `show running-config | include ^logging|^service (timestamps|sequence)`

```
service timestamps debug datetime msec
service timestamps log datetime msec show-timezone
service sequence-numbers
logging source-interface GigabitEthernet4 vrf MGMT
logging host 192.168.99.10 vrf MGMT
```

R2 `show running-config | include ^logging|^service (timestamps|sequence)`

```
service timestamps debug datetime msec
service timestamps log datetime msec show-timezone
service sequence-numbers
logging source-interface GigabitEthernet4 vrf MGMT
logging host 192.168.99.10 vrf MGMT
```

R3 `show running-config | include ^logging|^service (timestamps|sequence)`

```
service timestamps debug datetime msec
service timestamps log datetime msec show-timezone

logging source-interface GigabitEthernet4 vrf MGMT
logging host 192.168.99.10 vrf MGMT
```

Teardown (suite) Close Collector, Close All Connections

15.03 **PASS** Every Router Reports The Collector As An Active Logging Host (0.2s, 3 commands)

The router's own view: it should name the collector and show a non-zero count of messages sent to it.

Setup (suite) Start Collector And Routers

Acceptance criteria

- output contains `${SYSLOG_HOST}` (checked 3×)
- output contains **level** `${TRAP_LEVEL}` (checked 3×)

How it was checked

```
R1 show logging | include Trap logging|Logging to 192.168.99.10
  Trap logging: level informational, 2200 message lines logged
    Logging to 192.168.99.10 (MGMT) (udp port 514, audit disabled,
R2 show logging | include Trap logging|Logging to 192.168.99.10
  Trap logging: level informational, 2665 message lines logged
    Logging to 192.168.99.10 (MGMT) (udp port 514, audit disabled,
R3 show logging | include Trap logging|Logging to 192.168.99.10
  Trap logging: level informational, 1917 message lines logged
    Logging to 192.168.99.10 (MGMT) (udp port 514, audit disabled,
```

Teardown (suite) Close Collector, Close All Connections

15.04 PASS The Hub Message Reaches The Collector (4.0s, 1 commands)

End to end over the LAN: emit a uniquely marked message and find it at the collector.

Setup (suite) Start Collector And Routers

Acceptance criteria

- $\${n} > 0$ holds

How it was checked

```
NMS sudo grep -c -- 'LABSYSLOG-HUB-114324' /var/log/lab/192.168.99.1.log 2>/dev/null || echo 0
1
```

Teardown (suite) Close Collector, Close All Connections

15.05 PASS Each Spoke Message Reaches The Collector Across The Tunnel (8.1s, 2 commands)

The spokes have no direct path to h1's LAN; their messages are carried by the tunnels and the hub's routing.

Setup (suite) Start Collector And Routers

Acceptance criteria

- $\${n} > 0$ holds (checked 2×)

How it was checked

```
NMS sudo grep -c -- 'LABSYSLOG-R2-114324' /var/log/lab/192.168.99.2.log 2>/dev/null || echo 0
1
```

```
NMS sudo grep -c -- 'LABSYSLOG-R3-114324' /var/log/lab/192.168.99.3.log 2>/dev/null || echo 0
1
```

Teardown (suite) Close Collector, Close All Connections

15.06 PASS Received Messages Carry Facility Severity And Mnemonic (4.1s, 2 commands)

Setup (suite) Start Collector And Routers

Acceptance criteria

- $\${n} > 0$ holds
- $\${m}[\text{facility}]$ equals **FACCHECK**
- $\${m}[\text{mnemonic}]$ equals **MNEMCHECK**
- $\${m}[\text{sev}]$ equals **5**

```

Teardown (suite) Close Collector, Close All Connections

15.09 PASS Messages Below The Trap Level Are Not Forwarded (14.0s, 1 commands)

Negative control. Trap level is informational (6), so a debug-severity (7) message must not reach the collector. If this ever passes traffic, the level filter is not working and the positive tests above prove much less than they appear to.

Setup (suite) Start Collector And Routers

Acceptance criteria

- $\${n}$ equals 0
- a debug-severity message reached the collector despite trap level $\${TRAP_LEVEL}$

How it was checked

```
NMS sudo grep -c -- 'LABSYSLOG-DEBUG-114324' /var/log/lab/192.168.99.1.log 2>/dev/null || echo 0
0
0
```

Teardown (suite) Close Collector, Close All Connections

15.10 PASS All Three Routers Are Represented At The Collector (12.1s, 3 commands)

Messages from every router, distinguishable at the collector, which is the point of a central log host.

Setup (suite) Start Collector And Routers

Acceptance criteria

- $\${n} > 0$ holds (checked 3×)

How it was checked

```
NMS sudo grep -c -- 'LABSYSLOG-ALL-R1-114324' /var/log/lab/192.168.99.1.log 2>/dev/null || echo 0
1
NMS sudo grep -c -- 'LABSYSLOG-ALL-R2-114324' /var/log/lab/192.168.99.2.log 2>/dev/null || echo 0
1
NMS sudo grep -c -- 'LABSYSLOG-ALL-R3-114324' /var/log/lab/192.168.99.3.log 2>/dev/null || echo 0
1
```

Teardown (suite) Close Collector, Close All Connections

16 Snmpv3

16.01 PASS Both Trap Receivers Are Services On The NMS (0.1s, 2 commands)

snmptrapd on the standard port and the raw capture on a second one, both system services rather than listeners a suite starts -- so no run can leave one behind, which is how a negative test once passed while nothing was arriving.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- `${state}` equals **active active**
- output contains `:${TRAP_PORT}`
- output contains `:${TRAP_RAW_PORT}`

How it was checked

```
NMS systemctl is-active snmptrapd lab-trapcap | tr '\n' ' '
active active

NMS sudo ss -ltnp | grep -E ':(162|1162) ' || echo NONE
UNCONN 0      0      0.0.0.0:1162    0.0.0.0:*      users:(("python3",pid=1288,fd=3))
UNCONN 0      0      0.0.0.0:162    0.0.0.0:*

Teardown (suite) Close Trap Collector, Close All Connections

16.08 PASS Received Traps Are SNMP Version 3 (0.5s, 3 commands)

Reads the version field out of the datagram itself rather than trusting the configuration.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- **{traps}** is not empty (checked 3×)
- **{versions}** equals **{{[3]}}** (checked 3×)

How it was checked

NMS `sudo cat /var/log/lab/traps-raw.log 2>/dev/null || true`

Teardown (suite) Close Trap Collector, Close All Connections

16.09 PASS Received Traps Carry The Configured User And Privacy Flags (0.5s, 3 commands)

Setup (suite) Start Snmp Collectors

Acceptance criteria

- `#{users}` equals `#{['${SNMP_USER}']}` (checked 3×)
- `#{all_priv}` holds (checked 3×)

How it was checked

NMS `sudo cat /var/log/lab/traps-raw.log 2>/dev/null || true`

Teardown (suite) Close Trap Collector, Close All Connections

16.10 PASS Trap Payloads Are Encrypted (0.5s, 3 commands)

With privacy in force the scoped PDU arrives as a opaque OCTET STRING. If it were a readable SEQUENCE the varbinds would be on the wire in clear.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- `#{encrypted}` holds (checked 3×)

How it was checked

NMS `sudo cat /var/log/lab/traps-raw.log 2>/dev/null || true`

Teardown (suite) Close Trap Collector, Close All Connections

16.11 PASS snmptrapd Decrypts Traps From Every Router (0.3s, 3 commands)

The strongest single statement this suite makes: a real SNMP manager, holding only the configured user and each router's engine ID, authenticated and decrypted the traps. That cannot happen unless the keys, the engine IDs and the privacy protocol all match on both sides.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- **{entries}** is not empty (checked 3×)
- **{oids}** is not empty (checked 3×)

How it was checked

NMS `sudo cat /var/log/lab/snmptrapd.log 2>/dev/null || true`

```

Teardown (suite) Close Trap Collector, Close All Connections

16.12 PASS One Raw Listener Receives Every Router (0.1s, 1 commands)

The property the per-router-port workaround existed to dodge: a single socket now serves all three senders.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- output contains `#{R1_OOB_IP}`
- output contains `#{R2_OOB_IP}`
- output contains `#{R3_OOB_IP}`

How it was checked

NMS `sudo cat /var/log/lab/traps-raw.log 2>/dev/null || true`

```

Teardown (suite) Close Trap Collector, Close All Connections

16.13 PASS Each Router Identifies Itself By Its Own Engine ID (0.6s, 6 commands)

The engine ID in the received trap must match the one the router reports, and must differ between routers -- that is what lets a collector attribute a trap to a device.

Setup (suite) Start Snmp Collectors

Acceptance criteria

- **`\${local}`** is not empty (checked 3×)
- **`\${ids}`** has exactly **1** entries (checked 3×)
- **`\${ids}[0]`** equals **`\${expected}`** (checked 3×)
- **`\${distinct}`** equals **3**

the three routers did not present three distinct engine IDs: **`\${seen}`**

How it was checked

R1 show snmp engineID | include Local

```
Local SNMP engineID: 800000090300525400C80101
```

NMS sudo cat /var/log/lab/traps-raw.log 2>/dev/null || true

```

Teardown (suite) Close Trap Collector, Close All Connections

17 Snmp Polling

17.01 PASS The NMS Runs Real Net-SNMP Tooling (0.1s, 2 commands)

The point of this VM: unlike the cirros hosts it has a genuine SNMP client, so the polling below is the real thing rather than something hand rolled for the test.

Setup (suite) Open All Routers, Open Nms

Acceptance criteria

- output contains **NET-SNMP version**
- output contains **snmpget**
- output contains **snmpwalk**

How it was checked

NMS `snmpget --version 2>&1 | head -2; snmpwalk --version 2>&1 | head -1`

```
NET-SNMP version: 5.9.4.pre2
NET-SNMP version: 5.9.4.pre2
```

NMS `command -v snmpget snmpwalk snmptrapd`

```
/usr/bin/snmpget
/usr/bin/snmpwalk
/usr/sbin/snmptrapd
```

Teardown (suite) Close Nms, Close All Connections

17.02 PASS Every Router Answers An SNMPv3 authPriv Poll (0.2s, 3 commands)

The agent must be reachable and must accept the credentials the provisioner configured.

Setup (suite) Open All Routers, Open Nms

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.1 1.3.6.1.2.1.1.5.0`

```
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r1.lab.local"
```

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.2 1.3.6.1.2.1.1.5.0`

```
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r2.lab.local"
```

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.3 1.3.6.1.2.1.1.5.0`

```
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r3.lab.local"
```

Teardown (suite) Close Nms, Close All Connections

17.03 PASS Polled sysName Matches The Router's Own Hostname (0.4s, 6 commands)

Cross-check: the value SNMP returns is compared against what the device says on its CLI, so a plausible-looking answer from the wrong box cannot pass.

Setup (suite) Open All Routers, Open Nms

Acceptance criteria

- **`\${polled}`** starts with **`\${expected}`[0]** (checked 3×)
- `msg=SNMP sysName `${polled}` does not match CLI hostname `${expected}`[0]`

How it was checked

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.1 1.3.6.1.2.1.1.5.0`

```
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r1.lab.local"
```

R1 `show running-config | include ^hostname`

```
hostname c8000v-r1
```

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.2 1.3.6.1.2.1.1.5.0`

```
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r2.lab.local"
```

```
R2 show running-config | include ^hostname
hostname c8000v-r2
```

```
NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.3
1.3.6.1.2.1.1.5.0
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r3.lab.local"
```

```
R3 show running-config | include ^hostname
hostname c8000v-r3
```

Teardown (suite) Close Nms, Close All Connections

17.04 PASS Polled sysDescr Identifies The Platform (0.2s, 6 commands)

Setup (suite) Open All Routers, Open Nms

Acceptance criteria

- output matches Cisco IOS[-]XE Software[Cisco IOS Software \[IOSXE\]] (checked 3×)

How it was checked

```
NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.1

Teardown (suite) Close Nms, Close All Connections

17.10 PASS A Wrong Authentication Password Is Refused (0.1s, 2 commands)

Negative control. The agent answers the correct credentials first, so a refusal here cannot be a dead router.

Setup (suite) Open All Routers, Open Nms

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked

```

NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.1
1.3.6.1.2.1.1.5.0
.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r1.lab.local"

NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A NotTheRightPassword -x AES -X LabPrivPass123 -t 2 -r 0
192.168.99.1 1.3.6.1.2.1.1.5.0
snmpget: Authentication failure (incorrect password, community or key)

```

Teardown (suite) Close Nms, Close All Connections

17.11 PASS A Wrong Privacy Password Is Refused (2.2s, 3 commands)

Authentication succeeds but the payload will not decrypt, so the router drops the request silently and the client times out. Bracketed by a good poll to prove it is still alive.

Setup (suite) Open All Routers, Open Nms

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked

```
NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.1 1.3.6.1.2.1.1.5.0
```

```
.1.3.6.1.2.1.1.5.0 = STRING: "c800v-r1.lab.local"

NMS `snmpget -On -v2c -c public -t 2 -r 0 192.168.99.3 1.3.6.1.2.1.1.5.0`

Timeout: No Response from 192.168.99.3.

NMS `snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.3 1.3.6.1.2.1.1.5.0`

.1.3.6.1.2.1.1.5.0 = STRING: "c8000v-r3.lab.local"

Teardown (suite) Close Nms, Close All Connections

18 Mtu

18.01 PASS Every Tunnel Reports The Expected Transport MTU (0.3s, 9 commands)

The tunnel MTU must be below the physical one by the ESP overhead. Equal would mean encryption costs nothing, which would mean it is not happening.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- `${tunnels}` is not empty (checked 3×)
- output contains `${TUNNEL_MTU} bytes` (checked 3×)
- output contains `MTU is ${TUNNEL_MTU} bytes` (checked 3×)
- `${TUNNEL_MTU} < ${PHYSICAL_MTU}` holds

How it was checked

```
R1 show ip interface brief | include ^Tunnel
Tunnel0          172.20.0.1      YES NVRAM  up          up

R1 show interfaces Tunnel0 | include Tunnel transport MTU
Tunnel transport MTU 1472 bytes

R1 show ip interface Tunnel0 | include MTU
MTU is 1472 bytes

R2 show ip interface brief | include ^Tunnel
Tunnel0          172.20.0.2      YES NVRAM  up          up

R2 show interfaces Tunnel0 | include Tunnel transport MTU
Tunnel transport MTU 1472 bytes

R2 show ip interface Tunnel0 | include MTU
MTU is 1472 bytes

R3 show ip interface brief | include ^Tunnel
Tunnel0          172.20.0.3      YES NVRAM  up          up

R3 show interfaces Tunnel0 | include Tunnel transport MTU
Tunnel transport MTU 1472 bytes

R3 show ip interface Tunnel0 | include MTU
MTU is 1472 bytes
```

Teardown (suite) Close All Connections

18.02 PASS The Overhead Is What GRE With A Tunnel Key Costs (0.0s, 0 commands)

Records the number rather than assuming it: 20 bytes of outer IP, 4 of GRE and 4 for the tunnel key. If the encapsulation changes -- dropping the key, or moving IPsec from transport to tunnel mode -- this is the test that should fail first.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- `${overhead}` equals 28

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Close All Connections

18.03 PASS A Packet Exactly At The Tunnel MTU Crosses With DF Set (0.1s, 2 commands)

The permissive half of the boundary. Sourced from Loopback1 so the traffic is inside the protected selector. Warmed up first: the first packet between two spokes is consumed establishing the shortcut and its security association, so a cold measurement here reports 80 percent and says nothing about the MTU. That first-packet loss is DMVPN working, not failing.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains **Success rate is 100 percent**
a packet of exactly the tunnel MTU (`${TUNNEL_MTU}`) did not cross

How it was checked

```
R2 ping 10.20.3.1 source Loopback1 repeat 5
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

R2 ping 10.20.3.1 source Loopback1 size 1472 df-bit repeat 5

```
Type escape sequence to abort.
Sending 5, 1472-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
Packet sent with the DF bit set
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

Teardown (suite) Close All Connections

18.04 **PASS** One Byte Over The Tunnel MTU Does Not Cross With DF Set (10.0s, 1 commands)

The restrictive half. Without this the test above would pass just as well against a tunnel with no MTU limit at all.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains **Success rate is 0 percent**
a packet one byte over the tunnel MTU crossed with DF set

How it was checked

R2 ping 10.20.3.1 source Loopback1 size 1473 df-bit repeat 5

```
Type escape sequence to abort.
Sending 5, 1473-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
Packet sent with the DF bit set
.....
Success rate is 0 percent (0/5)
```

Teardown (suite) Close All Connections

18.05 **PASS** Oversize Traffic Still Crosses When Fragmentation Is Allowed (0.1s, 2 commands)

Distinguishes an MTU limit from a blackhole: the same sizes that fail with DF set must succeed without it.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains **Success rate is 100 percent** (checked 2×)
a \${size}-byte packet failed even with fragmentation allowed

How it was checked

R2 ping 10.20.3.1 source Loopback1 size 1500 repeat 5

```
Type escape sequence to abort.
Sending 5, 1500-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/3 ms
```

R2 ping 10.20.3.1 source Loopback1 size 2000 repeat 5

```
Type escape sequence to abort.
Sending 5, 2000-byte ICMP Echos to 10.20.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.2.1
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/3 ms
```

Teardown (suite) Close All Connections

18.06 **PASS** Hosts Pass Sub-MTU Traffic With DF Set (4.0s, 1 commands)

End to end across two encrypt/decrypt hops, from machines that know nothing about the tunnel.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains , 0% packet loss
- a host could not pass \${HOST_PAYLOAD} bytes with DF set

How it was checked

```
H2 ping -c 5 -M do -s 1444 192.168.30.10
PING 192.168.30.10 (192.168.30.10) 1444(1472) bytes of data.
1452 bytes from 192.168.30.10: icmp_seq=1 ttl=62 time=1.41 ms
1452 bytes from 192.168.30.10: icmp_seq=2 ttl=62 time=1.59 ms
1452 bytes from 192.168.30.10: icmp_seq=3 ttl=62 time=1.31 ms

1452 bytes from 192.168.30.10: icmp_seq=5 ttl=62 time=1.35 ms

--- 192.168.30.10 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4006ms
rtt min/avg/max/mdev = 1.312/1.401/1.587/0.097 ms
```

Teardown (suite) Close All Connections

18.07 PASS An End Host Learns The Tunnel Path MTU (2.0s, 1 commands)

The test that matters most in practice. The host is two hops and an encryption boundary away from the constraint, yet it must end up knowing the real limit -- otherwise a client retransmits into a black hole instead of backing off. The host reporting the exact tunnel MTU is proof that path MTU discovery survived the tunnel.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains **mtu=\${TUNNEL_MTU}**
- the host did not learn the \${TUNNEL_MTU}-byte path MTU: \${out}

How it was checked

```
H2 ping -c 2 -M do -s 1472 192.168.30.10
PING 192.168.30.10 (192.168.30.10) 1472(1500) bytes of data.
From 192.168.20.1 icmp_seq=1 Frag needed and DF set (mtu = 1472)
ping: local error: message too long, mtu=1472

--- 192.168.30.10 ping statistics ---
2 packets transmitted, 0 received, +2 errors, 100% packet loss, time 1014ms
```

Teardown (suite) Close All Connections

18.08 PASS Hosts Pass Oversize Traffic Without DF Set (4.0s, 1 commands)

The counterpart: the same payload that was refused with DF set gets through when it may be fragmented.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains , 0% packet loss
- oversize host traffic failed even with fragmentation allowed

How it was checked

```
H2 ping -c 5 -s 1472 192.168.30.10
PING 192.168.30.10 (192.168.30.10) 1472(1500) bytes of data.
1480 bytes from 192.168.30.10: icmp_seq=1 ttl=62 time=1.92 ms
1480 bytes from 192.168.30.10: icmp_seq=2 ttl=62 time=1.44 ms
1480 bytes from 192.168.30.10: icmp_seq=3 ttl=62 time=1.40 ms
1480 bytes from 192.168.30.10: icmp_seq=4 ttl=62 time=1.66 ms
1480 bytes from 192.168.30.10: icmp_seq=5 ttl=62 time=1.53 ms

--- 192.168.30.10 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4006ms
rtt min/avg/max/mdev = 1.398/1.588/1.917/0.186 ms
```

Teardown (suite) Close All Connections

19 Oob

19.01 PASS Every Router Has A Management VRF (0.0s, 3 commands)

Setup (suite) Open All Routers, Open Nms, Open Collector

Acceptance criteria

- output contains **MGMT_VRF** (checked 3×)
- output contains **ipv4** (checked 3×)

How it was checked

R1 show vrf

Name	Default RD	Protocols	Interfaces
MGMT	<not set>	ipv4	Gi4

R2 show vrf

Name	Default RD	Protocols	Interfaces
MGMT	<not set>	ipv4	Gi4

Teardown (suite) Restore Tunnels, Close Nms, Close Collector, Close All Connections

19.07 PASS Management Traffic Never Touches The Data Path (3.3s, 28 commands)

The negative property that makes this out-of-band. Polling a spoke used to cross an IPsec tunnel and was asserted to advance the ESP counters; now it must do the opposite. The comparison is against an idle window of the same length, because BGP and BFD tick those counters continuously regardless -- so an absolute delta proves nothing.

Setup (suite) Open All Routers, Open Nms, Open Collector

Acceptance criteria

- `${attributable} < ${POLL_BURST}` holds

How it was checked

```

Teardown (suite) Restore Tunnels, Close Nms, Close Collector, Close All Connections

19.08 PASS Syslog Reaches The Collector From The OOB Address (12.2s, 4 commands)

rsyslog files are named for the sender. A file named after a LAN address would mean the router is logging from the data path despite the configuration. Each router is made to emit a marked message rather than waiting on ambient traffic: whether a router happens to have logged recently is not what this test is about, and depending on it makes the result a matter of timing.

Setup (suite) Open All Routers, Open Nms, Open Collector

Acceptance criteria

- output contains `${OOB_IP}${r}` (checked 3×)
- `${n} > 0` holds (checked 3×)
- output does not contain `${r}_LAN_IP.log` (checked 3×)

How it was checked

```
NMS sudo grep -c -- 'LAB00B-SRC-R1-114539' /var/log/lab/192.168.99.1.log 2>/dev/null || echo 0
1
```

```
NMS sudo grep -c -- 'LAB00B-SRC-R2-114539' /var/log/lab/192.168.99.2.log 2>/dev/null || echo 0
1
```

```
NMS sudo grep -c -- 'LAB00B-SRC-R3-114539' /var/log/lab/192.168.99.3.log 2>/dev/null || echo 0
```

1

```
NMS sudo ls -l /var/log/lab
total 9628

```

Teardown (suite) Restore Tunnels, Close Nms, Close Collector, Close All Connections

19.09 PASS A Spoke Stays Manageable With Its Tunnel Down (19.4s, 16 commands)

The reason out-of-band management exists. Shutting R2's tunnel removes every data path between the hub and the spoke -- BGP drops, the LAN becomes unreachable -- and the spoke must still answer SNMP and keep logging, because none of that ever used the tunnel.

Setup (suite) Open All Routers, Open Nms, Open Collector

Acceptance criteria

- output contains **not in table** (checked 2×)
the hub can still reach R2's LAN, so the data path is not down yet
- **#{before}** equals **#{after}**
R2 stopped answering SNMP once its tunnel went down, so management is not out-of-band
- **#{n} > 0** holds
- output matches **#{peer}ls+4ls+#{peer_asn}(ls+ld+){5}ls+S+ls+ld+** (checked 3×)

How it was checked

```
NMS snmpget -On -v3 -l authPriv -u labmon -a SHA -A LabAuthPass123 -x AES -X LabPrivPass123 -t 3 -r 1 192.168.99.2

Teardown (this test) Restore Tunnels

20 Tacacs

20.01 **PASS** The TACACS Server Runs On The NMS (0.1s, 2 commands)

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- `${state}` equals **active**
tac_plus is not running on the NMS
- output contains `:${TAC_PORT}`
- output contains **tac_plus**

How it was checked

```
NMS systemctl is-active tacacs-lab
active
```

```
NMS sudo ss -ltnp | grep ':49 ' || echo NONE
LISTEN 0      128          0.0.0.0:49      0.0.0.0:*      users: (("tac_plus",pid=1460,fd=4))
LISTEN 0      128          [::]:49         [::]:*         users: (("tac_plus",pid=1460,fd=5))
```

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.02 **PASS** The Server Holds Both Remote Users And The Automation Account (0.1s, 1 commands)

The automation account has to exist on the server as well as locally on each router. Without it the first router to get AAA becomes unmanageable by this very test suite, while the server sits there perfectly healthy.

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- output contains `${ADMIN_USER}`
 - output contains `${OPS_USER}`
 - output contains `${USERNAME}`
- the automation account is missing from the server, which would lock the suite out

How it was checked

```
NMS sudo grep -oE '^user = [A-Za-z0-9_-]+' /etc/tacacs+/tac_plus.conf
user = netadmin
user = netops
user = lab
```

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.03 **PASS** Every Router Points At The Server Through The Management VRF (0.4s, 3 commands)

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- output contains **aaa new-model** (checked 3×)
- output contains **address ipv4 \${NMS_OOB_IP}** (checked 3×)
- output contains **ip vrf forwarding \${MGMT_VRF}** (checked 3×)
- output contains **ip tacacs source-interface \${OOB_INTF}[\${r}]** (checked 3×)

How it was checked

```
R1 show running-config | include ^aaa|^tacacs server|^ address ipv4|^ ip vrf forwarding|^ ip tacacs source

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.06 PASS A Remote Administrator Authenticates And Is Given Privilege 15 (0.3s, 0 commands)

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- `${priv}` equals `${ADMIN_PRIV}` (checked 3×)

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.07 PASS A Remote Operator Authenticates And Is Held At Privilege 1 (0.2s, 0 commands)

The pair that proves the level comes from the server. Two users, same router, same method list, different levels -- which cannot happen if the router is applying a default.

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- `${priv}` equals `${OPS_PRIV}` (checked 3×)

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.08 PASS A Wrong Password Is Refused (2.1s, 0 commands)

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.09 PASS An Unknown User Is Refused (2.0s, 0 commands)

The server rejects the user and the router honours that rather than quietly trying the local database.

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.10 PASS The Server Records Authentication In Its Accounting Log (0.1s, 1 commands)

Accounting is what makes remote authentication auditable; without it the router knows who logged in and nobody else ever finds out.

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked

```

Teardown (suite) Restore Oob Interfaces, Close Tacacs Server, Close All Connections

20.12 PASS The Local Account Still Works When The Server Is Unreachable (19.6s, 21

commands)

The resilience property. R2's out-of-band interface is shut, which is the only path to the server, so TACACS becomes unreachable rather than merely unwilling. The automation account must still get in through the local database, and a remote-only user must not -- it exists nowhere else. The precondition is a ping inside the VRF, not "show tacacs". That field reports cached state -- it keeps saying Alive until a transaction actually fails -- so waiting on it would either hang or, worse, let this test run with the server still reachable and prove nothing.

Setup (suite) Open All Routers, Open Tacacs Server

Acceptance criteria

- output matches **Success rate is 0 percent|does not have a usable source address**
 - **\${priv}** equals **15**
- the local account could not get in with the server unreachable
- output contains **Success rate is 100 percent** (checked 4x)

How it was checked

R2 `configure terminal`

Enter configuration commands, one per line. End with CNTL/Z.

R2 `interface GigabitEthernet4`

`${output} =`

R2 `shutdown`

`${output} =`

R2 `end`

`${output} =`

```

R2 ping vrf MGMT 192.168.99.10 repeat 2
% VRF MGMT does not have a usable source address

R1 configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

R1 interface GigabitEthernet4
${output} =

R1 no shutdown
${output} =

R1 end
${output} =

R2 configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

R2 interface GigabitEthernet4
${output} =

R2 no shutdown
${output} =

R2 end
${output} =

R3 configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

R3 interface GigabitEthernet4
${output} =

R3 no shutdown
${output} =

R3 end
${output} =

R2 ping vrf MGMT 192.168.99.10 repeat 5
% VRF MGMT does not have a usable source address

R2 ping vrf MGMT 192.168.99.10 repeat 5
% VRF MGMT does not have a usable source address

R2 ping vrf MGMT 192.168.99.10 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.99.10, timeout is 2 seconds:
.!!!!
Success rate is 80 percent (4/5), round-trip min/avg/max = 1/1/1 ms

R2 ping vrf MGMT 192.168.99.10 repeat 5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.99.10, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/3 ms

```

Teardown (this test) Restore Oob Interfaces

21 Vty Acl

21.01 **PASS** Every Router Applies The ACL Inbound On All VTY Lines (0.3s, 3 commands)

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- output contains **access-class \${VTY_ACL} in vrf-also** (checked 3×)

How it was checked

R1 show running-config | section ^line vty

```
line vty 0 4
access-class VTY-MGMT in vrf-also
exec-timeout 0 0
activation-character 13
transport input ssh
line vty 5 15

transport input ssh
line vty 5 15
access-class VTY-MGMT in vrf-also
exec-timeout 0 0
activation-character 13
transport input ssh

```

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

21.03 PASS The ACL Permits The Management Network And Denies The Rest (0.1s, 3 commands)

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- output contains **permit** **`\${OOB\_NET}`**, wildcard bits **0.0.0.255** (checked 3×)
 - output contains **deny** (checked 3×)
- any log

How it was checked

R1 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255 (4 matches)
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
 30 deny any log (6 matches)

```

R2 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (242 matches)
 30 deny any log (2 matches)

```

R3 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
 30 deny any log (2 matches)

```

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

21.04 PASS The Documented Exception Is Present And Is Only The Hypervisor Path (0.1s, 3 commands)

Pinned deliberately. This permit is the one concession in the policy, so it should be visible in a test rather than only in a comment -- and widening it should break something.

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- output contains **permit** **`\${MGMT\_NAT\_NET}`**, wildcard bits **0.0.0.255** (checked 3×)
- **`\${permits}`** has exactly **2** entries (checked 3×)

How it was checked

R1 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255 (4 matches)
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
 30 deny any log (6 matches)

```

R2 show ip access-lists VTY-MGMT

```
Standard IP access list VTY-MGMT
10 permit 192.168.99.0, wildcard bits 0.0.0.255
20 permit 10.0.2.0, wildcard bits 0.0.0.255 (242 matches)
30 deny any log (2 matches)
```

R3 show ip access-lists VTY-MGMT

```
Standard IP access list VTY-MGMT
10 permit 192.168.99.0, wildcard bits 0.0.0.255
20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
30 deny any log (2 matches)
```

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

21.05 PASS SSH From The Management Network Is Allowed (0.0s, 1 commands)

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- `${banner}` starts with SSH-

How it was checked

NMS python3 -c "import socket,sys

```
s=socket.socket()
s.settimeout(6)
s.bind(('192.168.99.10',0))

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

21.08 PASS The Refusal Is Logged And Reaches The Collector (0.1s, 2 commands)

"deny any log" makes a rejected connection auditable rather than merely blocked, and the message travels the OOB network to the collector like every other log.

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- output matches **SEC-6-IPACCESSLOGS***
no access-list denial logged by \${router} reached the collector

How it was checked

NMS python3 -c "import socket,sys

```
s=socket.socket()
s.settimeout(6)
s.bind(('192.168.10.20',0))
try:
    s.connect(('192.168.10.1',22))
    print(s.recv(64).decode(errors='replace').strip() or 'EMPTY')
except Exception as e:
    print(f'REFUSED {type(e).__name__}: {e}')
"
```

REFUSED ConnectionRefusedError: [Errno 111] Connection refused

NMS sudo cat /var/log/lab/192.168.99.1.log 2>/dev/null || true

```

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

21.09 PASS The Harness Path Still Works (0.1s, 3 commands)

The reason the second permit exists. If this fails the lab is unreachable by every other suite, so it is asserted here rather than discovered in the next run. Asserted from the ACL's own hit counter rather than from "show users". That column prints a resolved name when reverse DNS answers -- inside the packaged appliance the same session shows as "_gateway" instead of 10.0.2.2 -- so matching on the rendered address made this depend on name resolution rather than on the thing being tested. A hit on that ACE means a session was admitted by exactly the permit under discussion.

Setup (suite) Open All Routers, Open Tacacs Server, Open Collector

Acceptance criteria

- `${hits}` is not empty (checked 3×)
- `${hits}[0] > 0` holds (checked 3×)

How it was checked

R1 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255 (6 matches)
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
 30 deny any log (9 matches)

```

R2 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (242 matches)
 30 deny any log (3 matches)

```

R3 show ip access-lists VTY-MGMT

```

Standard IP access list VTY-MGMT
 10 permit 192.168.99.0, wildcard bits 0.0.0.255
 20 permit 10.0.2.0, wildcard bits 0.0.0.255 (206 matches)
 30 deny any log (3 matches)

```

Teardown (suite) Close Tacacs Server, Close Collector, Close All Connections

22 Banner

22.01 **PASS** Every Router Has A Login Banner Configured (0.3s, 3 commands)

Setup (suite) Open All Routers

Acceptance criteria

- output contains **banner login** (checked 3×)

How it was checked

R1 `show running-config | include ^banner`
banner login ^C

R2 `show running-config | include ^banner`
banner login ^C

R3 `show running-config | include ^banner`
banner login ^C

Teardown (suite) Close All Connections

22.02 **PASS** The Banner Is Presented Before Authentication (6.2s, 0 commands)

Captured from a login that is refused, so the banner demonstrably reaches an unauthenticated client.

Setup (suite) Open All Routers

Acceptance criteria

- `${banner}` is not empty (checked 3×)

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Close All Connections

22.03 **PASS** The Presented Banner Matches The Source File Exactly (6.2s, 0 commands)

Line for line, not a substring match: a device carrying a stale or truncated copy should fail rather than pass on one memorable phrase still being present.

Setup (suite) Open All Routers

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Close All Connections

22.04 **PASS** The Banner States The Warning It Exists To Give (2.1s, 0 commands)

A banner that does not actually warn is decoration. These are the elements that make it one: restricted access, a statement of monitoring, and consent following from use.

Setup (suite) Open All Routers

Acceptance criteria

- output contains `${phrase}` (checked 4×)
the banner does not state: `${phrase}`

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Close All Connections

22.05 **PASS** The Banner Discloses Nothing About The Platform (6.3s, 0 commands)

An unauthenticated visitor should learn that they are not welcome, and nothing else. A banner naming the vendor, model, software or hostname helps whoever should not be there more than it helps anyone who should.

Setup (suite) Open All Routers

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Close All Connections

22.06 **PASS** The Banner Survives A Configuration Save (0.1s, 3 commands)

Guards the case where a banner is applied to the running configuration and never written -- present until the next reload, and absent exactly when it would be needed.

Setup (suite) Open All Routers

Acceptance criteria

- output contains **banner login** (checked 3×)

How it was checked

R1 `show startup-config | include ^banner`
banner login ^C

R2 `show startup-config | include ^banner`
banner login ^C

R3 `show startup-config | include ^banner`
banner login ^C

Teardown (suite) Close All Connections

23 Destructive

23.01 PASS A Shortcut Outlives The Hub, But Its Routing Does Not (62.7s, 29 commands)

The claim worth testing rather than assuming. A spoke-to-spoke tunnel is genuinely direct: the NHRP mapping and the IPsec session are between the spokes and the hub is not on the path. So the hub going away should not break it. Except that it does, one layer up. Both spokes learn each other's prefixes from BGP, and both peer only with the hub. Lose the hub and BFD tears those sessions down in about two seconds, the prefixes withdraw, and there is no route to put on the tunnel -- which is still sitting there, perfectly healthy, carrying nothing. So this asserts both halves: the tunnel address still answers, and the loopback behind it does not. The data plane is hub-independent here; the control plane is not.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output contains **peer WAN IP**
- output contains **not in table** (checked 2×)
- output contains **R3 WAN IP**

the direct NHRP mapping did not survive the hub, so the tunnel was never direct

- output contains **R3 WAN IP**

the spoke-to-spoke IPsec session did not survive the hub

- output contains **Success rate is 100 percent**

the direct tunnel stopped carrying traffic when the hub went away

- output contains **Success rate is 0 percent**

the spoke still routes to the far loopback with the hub down, so the

- output contains **WAN IP** (checked 8×)

- output contains **Known via** (checked 8×)

- output contains **Success rate is 100 percent**

the spokes cannot reach each other end to end, so the fabric is not converged

How it was checked

Teardown (suite) Restore Everything, Close All Connections

23.03 PASS Blocking The Spokes At The Underlay Falls Back Through The Hub (23.7s, 27 commands)

The realistic partial failure: two sites that can both reach the hub but not each other, which is what happens whenever a firewall between branches permits the head end and nothing else. Resolution cannot complete, so no shortcut forms -- and connectivity must survive anyway, through the hub. The suite's other fallback test only clears the cache, which is the easy version: nothing is stopping the shortcut from forming a moment later. Here it genuinely cannot.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- `#{rate}[0] > 0` holds
- output does not contain `#{R3_WAN_IP}`
a direct mapping formed even though the underlay between spokes is blocked
- output contains `#{R1_DMVPN_IP}`
traffic is not transiting the hub, so it is not using the fallback:\n#{trace}
- output contains `#{r}_WAN_IP` (checked 2x)
- output contains **Known via** (checked 2x)
- output contains **Success rate is 100 percent** (checked 2x)
the spokes cannot reach each other end to end, so the fabric is not converged

Teardown (this test) Remove Spoke Block

23.04 PASS An NHRP Authentication Mismatch Is Refused (52.7s, 30 commands)

The authentication string must match across the cloud. A spoke that gets it wrong is refused registration and simply never appears at the hub. Both caches have to be cleared to see it. The hub holds its registration entry for the full holdtime, so clearing only the spoke leaves the hub answering from a stale cache -- and the test reads "still registered" and concludes, wrongly, that the mismatch had no effect.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output does not contain `${peer}_WAN_IP`
the hub still holds a registration for `{peer}`
- output contains `${r}_WAN_IP` (checked 8×)
- output contains **Known via** (checked 8×)
- output contains **Success rate is 100 percent** (checked 2×)
the spokes cannot reach each other end to end, so the fabric is not converged

How it was checked

Teardown (this test) Restore Spoke Tunnel Settings

23.05 PASS A Tunnel Key Mismatch Fails Silently Instead (12.5s, 23 commands)

The same outcome by a different route, and the reason both are worth having. A wrong authentication string is a refusal. A wrong tunnel key is not refused by anything -- the GRE headers simply do not match, the packets are discarded, and the tunnel interface goes on reporting itself up with nothing passing through it.

Setup (suite) Open All Routers, Open All Hosts

Acceptance criteria

- output does not contain **`\${peer}\_WAN\_IP`**
the hub still holds a registration for **`\${peer}`**
- output matches **upls+up**
the interface reported itself down, which would make this failure the
- output contains **`\${r}\_WAN\_IP`** (checked 4×)
- output contains **Known via** (checked 2×)
- output contains **Success rate is 100 percent** (checked 2×)
the spokes cannot reach each other end to end, so the fabric is not converged

Teardown (this test) Restore Spoke Tunnel Settings

23.06 PASS Blocking The Too-Big Message Blackholes Large Traffic (7.3s, 18 commands)

The classic silent MTU failure. The router tells a host "fragmentation needed, MTU 1472" and the host adapts. Take that message away and nothing announces the fault: small packets keep working, ping keeps working, and anything bulk stalls with no diagnostic anywhere. The message is suppressed with "no ip unreachable" on the interface it would leave by -- R2's LAN side, facing the host. An outbound ACL was the obvious first choice and it does not work: an outbound ACL does not filter traffic the router originates, and this message is originated by R2. Applying it to Tunnel0 does nothing either, for the same reason -- the constraint is on the tunnel, but the message is emitted towards the host. Packet loss on its own proves nothing here: the oversized ping fails either way, because the host is forbidden to fragment it. What changes is whether anything says why, so the assertions are about the diagnostic and not the loss. This is what makes the boundary the MTU suite measures matter, and it is why that suite asserts the host learns the path MTU rather than merely that big packets fail.

Setup (this test) Wait For Converged Fabric

Acceptance criteria

- output contains **\${r}_WAN_IP** (checked 2×)
- output contains **Known via** (checked 2×)
- output contains **Success rate is 100 percent**
the spokes cannot reach each other end to end, so the fabric is not converged
- output contains **mtu = \${TUNNEL_MTU}**
the host did not learn the path MTU even before anything was blocked
- output contains **100% packet loss**
large traffic got through even with the too-big message suppressed
- output does not contain **mtu = \${TUNNEL_MTU}**
the host still learned the MTU, so the message was not actually suppressed
- output does not contain **Frag needed**
the host was still told fragmentation was needed, so the failure is not
- output contains **, 0% packet loss**
small packets failed too, so this is an outage rather than a blackhole

Teardown (this test) Remove Pmtu Block

23.07 PASS NHRP Mappings Are Soft State And Age Out (132.1s, 48 commands)

A shortcut is a cache entry, not configuration: it exists because traffic justified it and it should disappear when that stops being true. Proven with a shortened holdtime -- the configured 300s would add five minutes to every run for a property that is no truer at 300 than at 60. Expiry is not punctual. NHRP ages entries lazily, and a 60s holdtime was measured clearing at about 170s, so the wait here is generous rather than exact.

Setup (this test) Wait For Converged Fabric

Acceptance criteria

- output contains **`\${r}\_WAN\_IP`** (checked 6×)
 - output contains **Known via** (checked 4×)
 - output contains **Success rate is 100 percent** (checked 3×)
- the spokes cannot reach each other end to end, so the fabric is not converged
- output contains **`\${peer}\_WAN\_IP`** (checked 3×)
 - output does not contain **`\${peer}\_WAN\_IP`** (checked 11×)

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

Teardown (this test) Restore Holdtime

24 Terraform

24.01 **PASS** The Terraform Configuration Is Valid And Canonically Formatted (0.2s, 0 commands)

The cheapest gate there is, and the one most worth having first: a syntax or type error here would otherwise surface as a confusing failure several tests later.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Terraform Destroy, Close All Connections

24.02 **PASS** A Plan From An Empty State Proposes Every Managed Resource (0.3s, 0 commands)

Two resources on each of three routers. Asserting the count catches a provider that silently drops a device from the loop — a plan that proposes four resources instead of six still looks like success in the summary line.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **6 to add**

Terraform did not propose one loopback and one access list per router:\n\${out}

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Terraform Destroy, Close All Connections

24.03 **PASS** Apply Puts The Loopback On Every Router (1.1s, 3 commands)

The push itself, read back from the running configuration.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **description Managed by Terraform** (checked 3×)
- output contains **255.255.255.255** (checked 3×)

How it was checked

R1 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.1.1 255.255.255.255
end
```

R2 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.2.1 255.255.255.255
end
```

R3 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.3.1 255.255.255.255
end
```

Teardown (suite) Terraform Destroy, Close All Connections

24.04 PASS Each Router Receives Its Own Address, Not A Shared One (0.2s, 3 commands)

A per-device value has to survive the provider's device loop. If it does not, every router ends up with the first one's address — which still passes a test that only checks "an address is configured".

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **ip address \${expected}\${r}[address]** (checked 3×)

How it was checked

R1 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.1.1 255.255.255.255
end
```

R2 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.2.1 255.255.255.255
end
```

R3 show running-config interface Loopback99

Building configuration...

```
Current configuration : 100 bytes
!
interface Loopback99
  description Managed by Terraform
  ip address 10.99.3.1 255.255.255.255
end
```

Teardown (suite) Terraform Destroy, Close All Connections

24.05 PASS The Access List Arrives With Its Entries In Order (0.3s, 3 commands)

An ordered list is where a provider and a device are most likely to disagree. Sequence numbers make the order explicit, so it can be asserted rather than assumed.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **10 remark Managed by Terraform** (checked 3×)
- output contains **20 permit 10.99.0.0 0.0.255.255** (checked 3×)
- output contains **30 deny any** (checked 3×)
- **\${idx} >= 0** holds (checked 9×)
- **\${ten} < \${twenty} < \${thirty}** holds (checked 3×)

How it was checked

R1 show running-config | section ip access-list standard TF-MANAGED

```
ip access-list standard TF-MANAGED
10 remark Managed by Terraform
20 permit 10.99.0.0 0.0.255.255
30 deny any
```

R2 show running-config | section ip access-list standard TF-MANAGED

```
ip access-list standard TF-MANAGED
10 remark Managed by Terraform
20 permit 10.99.0.0 0.0.255.255
30 deny any
```

R3 show running-config | section ip access-list standard TF-MANAGED

```
ip access-list standard TF-MANAGED
10 remark Managed by Terraform
```

```
20 permit 10.99.0.0 0.0.255.255
30 deny any
```

Teardown (suite) Terraform Destroy, Close All Connections

24.06 **PASS** Applying The Same Configuration Twice Proposes Nothing (0.4s, 0 commands)

Idempotence, and the sharpest single check in this suite. A provider that cannot read back what it wrote reports a permanent difference here, which would mean every future plan is noisy and real drift becomes invisible in it.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria none asserted directly — this test captures state for the record, and is checked by the tests that read it

How it was checked no device commands of its own; the assertion read output captured earlier in the suite

Teardown (suite) Terraform Destroy, Close All Connections

24.07 **PASS** A Change Made By Hand Is Reported As Drift (3.6s, 4 commands)

The reason to keep configuration in Terraform at all. The device is edited from the CLI behind Terraform's back, and the next plan has to notice. The wait is not padding. A change made at the CLI is not immediately visible over RESTCONF: measured on this platform, a plan run in the same second reports no drift, and the same plan two seconds later reports it. Polling until the plan sees it keeps the test honest about what is being asserted -- that the drift is detected at all, not that it is detected instantly. It is also worth knowing beyond this test: any tool that writes at the CLI and verifies over RESTCONF can read its own change back as absent.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **\${HAND_EDIT}**
the plan proposes changes but does not name the hand edit, so it may
- output contains **1 to change**
drift on one attribute of one device did not produce exactly one change

How it was checked

R2 configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

R2 interface Loopback99

\${output} =

R2 description Changed by hand

\${output} =

R2 end

\${output} =

Teardown (this test) Terraform Apply

24.08 **PASS** Applying Puts A Hand-Edited Device Back (0.4s, 1 commands)

Detection is only half of it; the correction is what makes the declared state authoritative.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output contains **description Managed by Terraform**
R2 was not returned to the state Terraform declares
- output does not contain **\${HAND_EDIT}**
the hand edit survived an apply

How it was checked

R2 show running-config interface Loopback99

Building configuration...

Current configuration : 100 bytes

!

interface Loopback99

description Managed by Terraform

ip address 10.99.2.1 255.255.255.255

end

Teardown (suite) Terraform Destroy, Close All Connections

24.09 PASS Destroy Removes Everything Terraform Created (3.0s, 6 commands)

Taking it back matters as much as putting it there: a lab that cannot be returned to a known state stops being a lab.

Setup (suite) Open All Routers, Generate Terraform Variables, Terraform Init, Terraform Destroy

Acceptance criteria

- output does not contain **Managed by Terraform** (checked 3×)
- output does not contain **\${TF_ACL}** (checked 3×)
- **\${count}** equals 0

Terraform still holds \${count} resources in state after destroy

How it was checked

R1 show running-config interface Loopback99

^
% Invalid input detected at '^' marker.

R1 show running-config | include ip access-list standard TF-MANAGED
\${output} =

R2 show running-config interface Loopback99

^
% Invalid input detected at '^' marker.

R2 show running-config | include ip access-list standard TF-MANAGED
\${output} =

R3 show running-config interface Loopback99

^
% Invalid input detected at '^' marker.

R3 show running-config | include ip access-list standard TF-MANAGED
\${output} =

Teardown (suite) Terraform Destroy, Close All Connections

Appendix — captured device state

Written by suite *05 Capture State* during the run. Routing tables and protocol state first, then what the NMS sees for each router -- polled over SNMPv3, and received as syslog and traps -- then the full running configuration of each router.
